

**MATH 7752 - HOMEWORK 11**  
**DUE FRIDAY 04/29/22**

- (1) In this problem you will need the following two definitions.

**Definition 1:** Let  $L/F$  be a finite separable extension and let  $\overline{F}$  be an algebraic closure of  $F$  containing  $L$ . A subfield  $L'$  of  $\overline{F}$  is called **conjugate to  $L$  over  $F$**  if  $L' = \sigma(L)$  for some  $F$ -embedding  $\sigma : L \rightarrow \overline{F}$ . (Note:  $L/F$  is Galois if and only if the only conjugate to  $L$  over  $F$  is itself.)

**Definition 2:** A finite extension  $K/F$  is called a  **$p$ -extension** if  $K/F$  is **Galois** and  $\text{Gal}(K/F)$  is a  $p$ -group.

- (a) Let  $L/F$  be a separable extension of degree  $n$  and let  $K$  be the Galois closure of  $L$  over  $F$ . Prove that  $K$  can be written as a compositum  $L_1 L_2 \cdots L_n$ , where  $L_1, \dots, L_n$  are (not necessarily distinct) conjugates of  $L$  over  $F$ .
  - (b) Let  $K/F$  and  $L/F$  be finite  $p$ -extensions. Prove that  $KL/F$  is also a  $p$ -extension.
  - (c) Suppose that  $K/L$  and  $L/F$  are both  $p$ -extensions, and let  $M$  be the Galois closure of  $K$  over  $F$  (note: we do not know whether  $K/F$  is Galois or not). Prove that  $M/F$  is also a  $p$ -extension.
  - (d) Now assume only that  $L/F$  is a separable extension with  $[L : F] = p^r$ , for some  $r \geq 1$ . Let  $M$  be the Galois closure of  $L$  over  $F$ . Prove that  $[M : F]$  need not be a power of  $p$ .
- (2) Let  $f(x)$  and  $g(x)$  be irreducible polynomials in  $\mathbb{F}_p[x]$  of the same degree. Let  $F = \mathbb{F}_p[x]/(f(x))$ . Prove that  $g(x)$  splits completely over  $F$ .
- (3) Consider the polynomial  $f(x) = x^4 - 2x^2 - 5 \in \mathbb{Q}[x]$ .
- (a) Determine the Galois group  $G$  of the splitting field  $K$  of  $f(x)$  over  $\mathbb{Q}$ .
  - (b) Find all subgroups of  $G$  and their corresponding fixed fields. Which of those are normal extensions of  $\mathbb{Q}$ ?
- (4) Let  $p$  and  $q$  be distinct primes with  $q > p$ , and let  $K/F$  be a Galois extension of degree  $pq$ . Prove the following:
- (a) There exists a field  $L$  with  $F \subset L \subset K$  and  $[L : F] = q$ .
  - (b) There exists a **unique** field  $M$  with  $F \subset M \subset K$  and  $[M : F] = p$ .
- (5) Prove the following analogue of Kummer's theorem for abelian extensions: Let  $n \in \mathbb{N}$  and let  $F$  be a field containing a primitive  $n^{\text{th}}$  root of unity.
- (a) Let  $K/F$  be a finite Galois extension such that  $G = \text{Gal}(K/F)$  is abelian of exponent  $n$ . Then there exists  $a_1, \dots, a_t \in F$  such that  $K = F(\sqrt[n]{a_1}, \dots, \sqrt[n]{a_t})$ . More precisely, there exists  $\alpha_1, \dots, \alpha_t \in K$  such that  $K = F(\alpha_1, \dots, \alpha_t)$  and  $\alpha_i^n \in F$  for all  $i$ .
  - (b) Conversely, suppose that  $K = F(\sqrt[n]{a_1}, \dots, \sqrt[n]{a_t})$  for some  $a_1, \dots, a_t \in F$ . Prove that  $K/F$  is Galois and  $G = \text{Gal}(K/F)$  is abelian of exponent  $n$ . **Hint:** For part (b) use one of the problems from the previous homework.

- (6) Let  $F$  be a field containing a primitive  $n^{\text{th}}$  root of unity. Let  $a, b \in F$  be such that the polynomials  $f(x) = x^n - a$ , and  $g(x) = x^n - b$  are both irreducible over  $F$ . Consider the Kummer extensions  $F(\alpha)$ ,  $F(\beta)$ , where  $\alpha$  is a root of  $f(x)$  and  $\beta$  is a root of  $g(x)$ . Prove that  $F(\alpha) = F(\beta)$  if and only if  $\beta = c\alpha^r$ , for some  $c \in F$  and some integer  $r$  which is coprime to  $n$  (equivalently, if and only if  $b = c^n a^r$ , for some  $c \in F$  and some  $(r, n) = 1$ ).
