## Problem 1

Let  $R$  be a commutative domain, and let  $M$  be a free  $R$ -module with basis  $X = \{e_1, \dots, e_k\}$ , with  $k \geq 2$ . Prove that the element  $e_1 \otimes e_2 + e_2 \otimes e_1$  cannot be written as simple tensor  $m \otimes n$ , for some  $m, n \in M$ .

*Proof.* Suppose, for the sake of contradiction, that there exist  $m, n \in M$  such that  $m \otimes n = e_1 \otimes e_2 + e_2 \otimes e_1$ . Write  $m = \sum_{i=1}^n r_i e_i$  and  $n = \sum_{j=1}^n s_j e_j$  for some  $r_i, s_j \in R$ . Then

$$e_1 \otimes e_2 + e_2 \otimes e_1 = \left( \sum_{i=1}^n r_i e_i \right) \otimes \left( \sum_{j=1}^n s_j e_j \right) = \sum_{i,j} r_i s_j e_i \otimes e_j$$

Under this isomorphism  $M \cong R^n$  induced by the basis  $X$ , we have that

$$M \otimes M \cong R^n \otimes R^n \cong (R^n \otimes R)^n \cong (R \otimes R)^{n^2} \cong R^{n^2}$$

as  $R$ -modules. By the previous homework, as  $R$  is commutative, it follows that  $M \otimes M$  has well defined rank given by  $\text{rank}(M) = n^2$ .  $\square$

## Problem 2

Let  $R$  be a commutative ring (with 1) and  $n, m \in \mathbb{N}$ . Prove that there is an isomorphism of  **$R$ -algebras**  $R^n \otimes R^m \simeq R^{nm}$ . (Here by  $R^n$  we mean the direct sum  $\underbrace{R \oplus \dots \oplus R}_n$ .)

## Problem 3

(a) Let  $V$  be a finite-dimensional  $\mathbb{C}$ -vector space. Then  $V$  can be considered as a vector over  $\mathbb{R}$  (by restriction of scalars), and it holds  $\dim_{\mathbb{R}} V = 2 \dim_{\mathbb{C}} V$ . Prove that  $V \otimes_{\mathbb{C}} V$  is not isomorphic to  $V \otimes_{\mathbb{R}} V$  as  $\mathbb{R}$ -vector spaces, and compute their dimensions over  $\mathbb{R}$ .

(b) Let  $R$  be an integral domain (commutative), and let  $K$  be its fraction field. Prove that there is an isomorphism of  $F$ -modules,  $F \otimes_R F \simeq F \otimes_F F \simeq F$ , where the  $F$ -module structure on  $F \otimes_R F$  is given by **extension of scalars** (i.e. tensor product of Type I).

## Problem 4

The purpose of this problem is to classify all 2-dimensional  $\mathbb{R}$ -algebras (where  $\mathbb{R}$  are the real numbers). That means, to classify (up to algebra isomorphism) those  $\mathbb{R}$ -algebras that are 2-dimensional  $\mathbb{R}$  vector spaces. Let  $A$  be a 2-dimensional  $\mathbb{R}$ -algebra (with 1).

(a) Let  $u \in A$  be any element that is  $\mathbb{R}$ -linearly independent from 1. Prove that

- (i)  $u$  generates  $A$  as an  $\mathbb{R}$ -algebra. That is, the minimal  $\mathbb{R}$ -subalgebra of  $A$  containing  $u$  and 1 is  $A$  itself.
- (ii) The element  $u$  satisfies a quadratic equation  $au^2 + bu + c = 0$ , for some  $a, b, c \in \mathbb{R}$  with  $a \neq 0$ . Conclude that  $A$  is necessarily commutative.

*Proof.* Noting that the subalgebra generated by  $u$  contains  $\text{span}_{\mathbb{R}}(\{1, u\})$  which has dimension 2 as an  $\mathbb{R}$ -vector space, it follows that the subalgebra generated by  $u$  is in fact  $A$ .

Since the subalgebra generated by  $u$  is  $A$ , it follows that there exist  $a, b \in \mathbb{R}$  such that  $u^2 = au + b1$ , whence  $u^2 - au - b = 0$ . This implies the algebra  $A$  is commutative as multiplication is hence defined by the relations  $u \cdot 1 = u = 1 \cdot u$  and  $1 = 1 \cdot 1$ , which are all commutative.  $\square$

(b) Show that there exists some  $v \in A$  which is  $\mathbb{R}$ -linearly independent from 1 and is such that  $v^2 = -1$ , or  $v^2 = 1$ , or  $v^2 = 0$ .

*Proof.*  $\square$

(c) Deduce from part (b) that  $A$  is isomorphic as an  $\mathbb{R}$ -algebra to one of the following:  $\mathbb{R}[x]/(x^2 + 1)$ , or  $\mathbb{R}[x]/(x^2 - 1)$ , or  $\mathbb{R}[x]/(x^2)$ .

(d) Prove that the algebras  $\mathbb{R}[x]/(x^2 + 1)$ ,  $\mathbb{R}[x]/(x^2 - 1)$ , and  $\mathbb{R}[x]/(x^2)$  are pairwise non-isomorphic. **Hint:** This can be shown with almost no computation.

## Problem 5

The purpose of this problem is to prove the following theorem: Let  $D$  be a finite dimensional division algebra over  $\mathbb{R}$ . Then  $D$  is isomorphic to  $\mathbb{R}, \mathbb{C}$  or  $\mathbb{H}$  (the quaternions). One way to proceed is to use the following steps:

(a) Let  $\alpha \in D$  be an element  $\mathbb{R}$ -linearly independent from 1. Show that  $\alpha$  satisfies a quadratic irreducible polynomial  $p_{\alpha}(x) = x^2 + ax + b \in \mathbb{R}[x]$ .

(b) Let  $V = \{\alpha \in D : \alpha^2 \in \mathbb{R}_{<0}\}$ . Show that  $V$  is an  $\mathbb{R}$ -linear subspace of  $D$ . **Hint:** Show there is an  $\mathbb{R}$ -linear map  $f : D \rightarrow \mathbb{R}$  with kernel  $V$ .

(c) Define  $B : V \times V \rightarrow \mathbb{R}$ ,  $B(\alpha, \beta) := -\frac{\alpha\beta + \beta\alpha}{2}$ . Show that  $B$  defines an inner product on  $V$  (i.e.  $B$  is a symmetric, positive definite bilinear form on  $V$ ).

(d) Let  $W$  be a linear subspace of  $V$  that generates  $D$  as an  $\mathbb{R}$ -algebra. Let  $n = \dim_{\mathbb{R}} W$ . Choose an orthonormal basis of  $W$ , i.e. a basis  $\{e_i\}$  of  $W$  such that  $B(e_i, e_i) = 1$  for all  $i$  and  $B(e_i, e_j) = 0$  for all  $i \neq j$  (such a basis always exists). Using this orthonormal basis show that if  $n \geq 2$ , then  $D$  has a subalgebra isomorphic to  $\mathbb{H}$ .

(e) **Bonus:** Suppose  $n \geq 2$ . Prove that  $A = H$ . **Hint:** One way to proceed is to show that if  $n > 2$ , then the multiplication in  $D$  cannot be associative.
